The situation in the elderly care sector reflects modern day trends characterised by improvements in living standards, greater emphasis on service and constant change. Alongside this is a growing necessity for care homes to be efficient and cost-effective. Economical and flexible solutions, which allow these institutions to improve standards of quality and performance, are essential. Such solutions must take account of both the financial constraints of budgets and the practical limitations of installation in existing buildings.

All wireless functionality elements are surface-mounted which means installation with little noise, no mess and significant cost savings. These benefits qualify teleCARE M as the ideal solution for operational care homes where it can be installed and commissioned rapidly with minimum disruption.

The requirements of the call system in care homes are highly specialised and include a wide variety of very important aspects. Safety, security and mobility are just some of the considerations. Many care homes consist of old buildings where installation can be difficult and very costly. Despite the challenges, modern care homes must offer the very best service and maintain optimum levels of efficiency. The choice of call system plays a critical role in achieving these objectives.

A powerful call system without cables
teleCARE M is a very capable call system with wireless functionality developed specifically for the elderly care sector. Being wireless, the system allows total freedom in on-site planning and installation.

Modern care homes must offer the very best service and maintain optimum levels of efficiency

A wireless call system package offering everything you need
teleCARE M not only offers three levels of call from every call unit, but also an automatic battery low-power alarm signal. The range of teleCARE M call units covers all needs. Every wireless call unit can include a socket for connecting the teleCARE handset and even incorporate a wireless pull-cord switch.

A truly revolutionary feature is the ability to combine wireless teleCARE M devices with conventional "hard-wired" teleCARE M components. This means costs can be saved without sacrificing functionality. In addition to fixed call points, teleCARE M offers wrist call buttons providing residents with total mobility and security.

Costs can be saved without sacrificing functionality

Integration with messaging ensures maximum effectiveness

The integration of teleCARE M with messaging assures optimum effectiveness, resulting in every resident's call receiving the swiftest possible response. Each call unit has a unique identity which allows the individual care home to define the system configuration.

Subsequent alterations or extensions to the system can be carried out with a minimum of effort by simply adding or moving call units. This inherent flexibility enables easy reconfiguration at any time to match changing requirements.

A revolutionary system with many unique peripherals

- Modern, stylish peripherals specifically designed for the elderly care environment.
- Three function buttons and a connection socket in a single surface-mounted wireless call unit.
- A pull-cord and three function buttons in a single surface-mounted wireless call unit.
- The unique teleCARE M Safe Release plug which eliminates the problems of constant repairs to broken cables and wall sockets.
